

SOCIAL MEDIA & COMMUNITY INTERN

Social Media & Community Intern - Founding Hire

Transloka Bio Pvt Ltd - KritRNA platform

Remote and fully asynchronous - 3-month term, reviewable.

The one-line version

We are a rare-disease biotechnology company at the beginning. You will be the first person to decide how the company sounds when it speaks in public. You will not receive a content calendar to execute; you will build one.

The problem you will own

Some genetic diseases are caused by a premature stop signal that interrupts protein production. KritRNA is developing engineered suppressor tRNAs designed to help translation continue. Your job is to make that mechanism understandable and memorable without allowing the science to slip.

Reading through silence, restoring the protein.

How we work

- Fully remote and asynchronous. Work when your brain works.
- Output-based rather than hours-based.
- One live call each week with Pragati Bhaisora, Director of Outreach & Awareness.
- Deadlines are real; schedules are flexible and agreed in advance.
- When exams or serious personal circumstances affect delivery, communicate early so the work can be rescheduled rather than rushed.

What you will actually do

- Build the company voice, formats and cadence across Instagram and LinkedIn.
- Translate molecular biology into accurate short-form content for non-specialists.
- Write scripts, captions and carousels, and edit short-form video.
- Learn the rare-disease community and identify where the company can participate responsibly.
- Build early relationships with patient organisations without extracting from them.
- Report honestly on what is and is not working, using useful metrics rather than vanity numbers.

Non-negotiables

- Present the work as an approach under development, never as an existing cure.
- No medical advice, dosing guidance or promises in posts, direct messages or replies.
- Every factual claim must have a current source and date. Primary sources take priority.
- AI tools may be used, but nothing is published without human verification.

Who this is for

- You can hold accuracy and attention at the same time.
- You would cut a strong line rather than let it become slightly untrue.
- You are comfortable building without a brand book, precedent or established audience.
- You can show some evidence that you make things people watch, read or share.
- You do not need a biology background, but you must be willing to learn enough biology to communicate responsibly.

What comes with the role

This role offers direct ownership, public attribution and a path to continued work.

- Founding credit as the first dedicated public voice of the company.
- Real ownership of strategy, with Pragati providing direction and scientific review rather than micromanagement.
- A rare specialisation in science communication for a suppressor-tRNA therapeutics platform.
- Public attribution and a written recommendation at the end of the term.
- First consideration for continued communications work when the company expands the function.

How to apply

- Your portfolio, or two or three pieces of work you are proud of.
- A few lines explaining why this role rather than a generic social-media internship.
- Shortlisted candidates receive a short, scoped trial task; submissions are not used as free public content.

Email careers@hellokritrna.com with the subject line: Social Intern - [Your Name].

KritRNA communicates research-stage work. Selected candidates may be asked to sign confidentiality and appropriate internship documentation. Transloka Bio Pvt Ltd is an equal-opportunity employer and hires on evidence.
